Abstract: Dynamics in Indian States, infant and child mortality, PHC services and morbidity and mortality. Numerous determinants and differential factors affecting the above areas of studies were reported for plausible policy intervention measures. Some of these factors include family type, age at marriage, socio-economic status variables, modernization factors, interaction between fertility and mortality, family planning and formation variables, contraception, value of children and caste among others. The paper serves as a pathfinder into what has been done in the areas of fertility, mortality, family planning and nuptiality. It also recommends that such review of research works be done periodically for better insight update in order to guide researches/researchers on related areas for in depth impact on the society.

Key words: Population, research, fertility, family planning, nuptiality and mortality.
