Abstract:

This research study was designed to explore stigmatization and discrimination related to people living with HIV/AIDS. The study employed the descriptive survey of By means of a self 116 participants. A research questionnaire elicited information on demography and stigmatization and discrimination amongst the people living with HIV/AIDS and the general population. Two hypotheses were formulated and tested. The result confirmed a significant combined contribution of family and workplace attitude, towards people living with HIV/AIDS. \( r = .408, r^2 = .166; F (2, 113) = 11.261; p < 0.005 \). The second hypothesis showed that there is no significant difference between male and female respondents in their workplace attitude towards people living with HIV/AIDS \( (t = 0.200, df = 114, p > 0.05, \text{one-tailed}) \). The study concludes that the society should be encouraged to have a change of attitude towards people living with HIV/AIDS. Empathy, support and care should be demonstrated to victims of HIV/AIDS in place of stigmatization and discrimination.
