Abstract: Over the years, researches in the UK, US, Astrailia and Nigeria have attempted to ascertain if valuations are good proxies for realized prices by means of statistical tests, particularly standard deviations and regression analyses. However, previous studies demonstrates that such comparisons of realized prices and prior valuations assume that valuations stand above the market, which is not the case in the UK market. This work aimed at determining if a casual relationship also does exist between prices and property development/property investment portfolios and commercial banks respectively. Data was measured by means of Kruskal-Wallis test on non-parametric data. It was discovered that values produced by valuation firms mimic those of in-house valuers of development companies/property investment portfolios and banks, both in method and figure. The valuations do not however stand above the market but have casual influence on price. It was advised that in order to prevent crashes such as was experienced in the UK, valuation stakeholders continue to drive the valuer to greater levels of efficiency.
