# PHY 225: Mathematical Methods in Physics (I)

CONTRIBUTOR: Emetera, M.E.

1. Show that the set of vectors  $\vec{a}, \vec{b}, \vec{c}$  are linearly independent. If

$$\vec{a} = \begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix}, \vec{b} = \begin{pmatrix} 2 \\ 3 \\ 4 \end{pmatrix}, \vec{c} = \begin{pmatrix} 3 \\ 4 \\ 5 \end{pmatrix}$$

Solution

If the set of vectors  $\vec{a}, \vec{b}, \vec{c}$  are linearly independent, then it must satisfy the condition

$$\alpha \vec{a} + \beta \vec{b} + \gamma \vec{c} = \vec{0}$$

$$\alpha \begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix} + \beta \begin{pmatrix} 2 \\ 3 \\ 4 \end{pmatrix} + \gamma \begin{pmatrix} 3 \\ 4 \\ 5 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \alpha + 2\beta + 3\gamma \\ 2\alpha + 3\beta + 4\gamma \\ 3\alpha + 4\beta + 5\gamma \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

Hence,

$$\begin{cases} \alpha + 2\beta + 3\gamma = 0 \\ 2\alpha + 3\beta + 4\gamma = 0 \\ 3\alpha + 4\beta + 5\gamma = 0 \end{cases}$$

Solving the sets of equations give

$$\begin{cases} \alpha = 3 \\ \beta = 5 \\ \gamma = 1 \end{cases}$$

Hence, the condition  $\alpha \vec{a} + \beta \vec{b} + \gamma \vec{c} = \vec{0}$  is satisfied. Therefore vectors  $\vec{a}, \vec{b}, \vec{c}$  are linearly independent.

2. Two particles emitting from a source have displacement at any time. Find the relative displacement of the second particle with respect to the first.

$$\vec{r}_1 = 8\hat{i} + 6\hat{j} + 2\hat{k}$$

$$\vec{r}_2 = 4\hat{i} + 10\hat{j} + 10\hat{k}$$

3. What unit vector is perpendicular to both  $\vec{a}$  and  $\vec{b}$ ?  
Find the angle between these vectors

Solution

The unit vector is perpendicular to both  $\vec{a}$  and  $\vec{b}$  is the unit vector in the direction of  $\vec{a} \times \vec{b}$

$$\vec{a} \times \vec{b} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 3 & 4 \\ 1 & 2 & 1 \end{vmatrix} = \hat{i}(3 \cdot 1 - 4 \cdot 2) - \hat{j}(2 \cdot 1 - 4 \cdot 1) + \hat{k}(2 \cdot 2 - 3 \cdot 1)$$

$$= -5\hat{i} + 2\hat{j} + \hat{k}$$

$$= \frac{-5\hat{i} + 2\hat{j} + \hat{k}}{\sqrt{30}}$$

Therefore, the required unit vector is

$$\frac{-5\hat{i} + 2\hat{j} + \hat{k}}{\sqrt{30}}$$

4. The electric field  $\vec{E}$ , magnetic field  $\vec{B}$  and velocity  $\vec{v}$  of a charged particle are given by

$$\vec{E} = 4\hat{i} + 3\hat{j} + 2\hat{k}$$

$$\vec{B} = 9\hat{i} + 12\hat{j} + 16\hat{k}$$

$$\vec{v} = 3\hat{i} + 4\hat{j} + 5\hat{k}$$

Determine the electrostatic and magnetic force on the charged particle

5. Show that the line of intersection of the planes  $x+2y+3z=0$  and  $3x+2y+z=0$  is equally inclined to the x and z axes and makes an angle  $\frac{\pi}{3}$  with the y-axis.

A line is given by  $\frac{x-2}{3} = \frac{y-4}{5} = \frac{z-1}{4}$ . Find the coordinates of the point P at which the line intersects the plane  $x+2y+3z=6$

Solution

The vector normal to the plane is  $\vec{n} = \hat{i} + 2\hat{j} + 3\hat{k}$ , hence,

$$\frac{x-2}{3} + \frac{y-4}{5} + \frac{z-1}{4} = \frac{6}{4}$$

This means that the line indeed intersects the plane

$$x = 1 + 4t, \quad y = 2 + 5t, \quad z = 3 + 6t$$

To find the point of intersection, we substitute the above equation into the equation  $x+2y+3z=6$ , so that  $1 + 4t + 2(2 + 5t) + 3(3 + 6t) = 6$

$$\begin{aligned} 1 + 4t &= 0 \\ 2 + 5t &= \frac{3}{4} \\ 3 + 6t &= \frac{3}{2} \end{aligned}$$

Hence the point of intersection is (0,

6. A particle of mass 2Kg moving with initial velocity of  $(2\mathbf{i} + 4\mathbf{j})$  m/s is acted upon by a constant force  $(2\mathbf{i} + 4\mathbf{j})$  N. Determine the distance and the velocity after 5s. Find the time in which the particle reaches the xy-plane.

7. Show that  $\psi = \frac{z^2}{2} - \frac{y^2}{2}$  satisfies the partial differential equation

$$\frac{\partial^2 \psi}{\partial x^2} + \frac{\partial^2 \psi}{\partial y^2} + \frac{\partial^2 \psi}{\partial z^2} = 0$$

8. Find the gradient of the scalar field  $\phi = 3x^2 + 4y^2 + 5z^2$

Solution

$$\begin{aligned} \phi &= 3x^2 + 4y^2 + 5z^2 \\ \nabla \phi &= \frac{\partial \phi}{\partial x} \mathbf{i} + \frac{\partial \phi}{\partial y} \mathbf{j} + \frac{\partial \phi}{\partial z} \mathbf{k} \\ &= 6x \mathbf{i} + 8y \mathbf{j} + 10z \mathbf{k} \\ &= 3(2x \mathbf{i} + \frac{8}{3}y \mathbf{j} + \frac{10}{3}z \mathbf{k}) \end{aligned}$$

9. Find the rate of change with respect to distance S of  $\phi = 3x^2 + 4y^2 + 5z^2$  at the point (1, 2, -1) in the direction  $\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$ . In which direction is the rate of change of  $\phi$  greatest at this point. What is the value in this direction?

10. Find the divergence of the vector field  $\mathbf{F} = x^2 \mathbf{i} + y^2 \mathbf{j} + z^2 \mathbf{k}$

Solution

$$\begin{aligned}
 \nabla^2 \phi &= \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} + \frac{\partial^2 \phi}{\partial z^2} \\
 &= \frac{\partial}{\partial x} \left( \frac{\partial \phi}{\partial x} \right) + \frac{\partial}{\partial y} \left( \frac{\partial \phi}{\partial y} \right) + \frac{\partial}{\partial z} \left( \frac{\partial \phi}{\partial z} \right)
 \end{aligned}$$

11. Find the laplacian of the scalar field  $\phi = \dots$

12. Find the curl of the function  $\mathbf{F} = \dots$

Solution

$$\begin{aligned}
 \nabla \times \mathbf{F} &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ F_x & F_y & F_z \end{vmatrix} \\
 &= \left( \frac{\partial F_z}{\partial y} - \frac{\partial F_y}{\partial z} \right) \hat{i} + \left( \frac{\partial F_x}{\partial z} - \frac{\partial F_z}{\partial x} \right) \hat{j} + \left( \frac{\partial F_y}{\partial x} - \frac{\partial F_x}{\partial y} \right) \hat{k}
 \end{aligned}$$

13. Express the vector  $\mathbf{A} = \dots$  in spherical polar coordinates. Find  $\nabla \times \mathbf{A}$  and  $\nabla \cdot \mathbf{A}$ .

14. Express the vector  $\mathbf{A} = \dots$  in cylindrical polar coordinates. Find  $\nabla \cdot \mathbf{A}$ .

Solution

$$\begin{aligned}
 \mathbf{A} &= A_r \hat{r} + A_\theta \hat{\theta} + A_z \hat{z} \\
 \nabla \cdot \mathbf{A} &= \frac{1}{r^2} \frac{\partial}{\partial r} (r^2 A_r) + \frac{1}{r \sin \theta} \frac{\partial}{\partial \theta} (\sin \theta A_\theta) + \frac{\partial A_z}{\partial z}
 \end{aligned}$$

By solving for  $A_r$  and  $A_\theta$  we have

$$\begin{aligned}
 \frac{\partial}{\partial r} (r^2 A_r) &= \dots \\
 \frac{\partial}{\partial \theta} (\sin \theta A_\theta) &= \dots
 \end{aligned}$$

Hence,  $A_r = \dots$  and  $A_\theta = \dots$

Applying same protocol for  $A_z$  and  $\dots$

Thus

$$\begin{aligned}
 \mathbf{A} &= A_r \hat{r} + A_\theta \hat{\theta} + A_z \hat{z} \\
 \nabla \cdot \mathbf{A} &= \dots
 \end{aligned}$$

By substituting  $z = \sqrt{a^2 - x^2 - y^2}$  into  $\int_C \mathbf{F} \cdot d\mathbf{r}$  then

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (2x^2 - y^2 + z^2) \cdot (-2x dx - 2y dy - 2z dz)$$

Hence

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (-2x^3 - 2xy^2 - 2xz^2 + 2y^3 - 2yz^2 - 2z^3) \cdot (-2x dx - 2y dy - 2z dz)$$

15. Evaluate the integral  $\int_C \mathbf{F} \cdot d\mathbf{r}$  where  $C$  is the circle in the  $xy$  plane defined by  $x^2 + y^2 = 4$ ,  $z=0$

16. Given that  $\mathbf{r}(t) = (2t^2, 2t, 4t^2)$  when  $t=2$  and  $\mathbf{r}(t) = (4t^2, 2t, 3t^2)$  when  $t=3$ . Show that  $\int_C \mathbf{F} \cdot d\mathbf{r} = 10$

Solution

$$\begin{aligned} \int_C \mathbf{F} \cdot d\mathbf{r} &= \int_C (2x^2 - y^2 + z^2) \cdot (4t dt) \\ &= \int_2^3 (8t^4 - 4t^2 + 16t^4) \cdot 4t dt \\ &= \frac{1}{2} [4t^6 - 4t^3 + 64t^5]_2^3 \\ &= \frac{1}{2} [4(3^6 - 2^6) - 4(3^3 - 2^3) + 64(3^5 - 2^5)] \\ &= \frac{1}{2} [4(729 - 64) - 4(27 - 8) + 64(243 - 32)] \\ &= \frac{1}{2} [4(665) - 4(19) + 64(211)] \\ &= \frac{1}{2} [2660 - 76 + 13504] \\ &= \frac{1}{2} [16184] = 8092 \end{aligned}$$

17. A vector field  $\mathbf{F}$  is given as  $\mathbf{F} = (4x^2y, 2xy^2, 2x^2y^2)$  where  $V$  is the region bounded by the surface  $x=0, y=0, y=6, Z=x^2, z=4$ . Evaluate the integral  $\int_V \text{div} \mathbf{F} \cdot dV$

18. State the Stoke's theorem

Solution

Stoke's theorem is the curl analogue of the divergence theorem. It relates the integral of the curl of a vector field over an open surface  $S$  to the line integral of the vector field around the perimeter  $C$  bounding the surface

19. Proof mathematically that Gauss law is valid for any Gaussian surface

Solution

Assume a cube. The divergence theorem is

we have 
$$\int_V (\nabla \cdot \mathbf{F}) \, dV = \int_S \mathbf{F} \cdot \mathbf{n} \, dS$$

Now the volume integral

$$\int_0^1 \int_0^1 \int_0^1 (x + y + z) \, dx \, dy \, dz = 2 \left( \frac{1}{2} + \frac{1}{2} + \frac{1}{2} \right) = 3$$

The surface integral is described by the six faces of the cube

$$\begin{aligned} & \int_{x=0}^1 \int_{y=0}^1 \int_{z=0}^1 (x + y + z) \, dz \, dy \, dx \\ & + \int_{x=1}^1 \int_{y=0}^1 \int_{z=0}^1 (x + y + z) \, dz \, dy \, dx \\ & + \int_{y=0}^1 \int_{x=0}^1 \int_{z=0}^1 (x + y + z) \, dz \, dx \, dy \\ & + \int_{y=1}^1 \int_{x=0}^1 \int_{z=0}^1 (x + y + z) \, dz \, dx \, dy \\ & + \int_{z=0}^1 \int_{x=0}^1 \int_{y=0}^1 (x + y + z) \, dy \, dx \, dz \\ & + \int_{z=1}^1 \int_{x=0}^1 \int_{y=0}^1 (x + y + z) \, dy \, dx \, dz \end{aligned}$$

$$\begin{aligned} & \int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (x^2 + y^2 + z^2) \mathbf{T} \cdot d\mathbf{r} \\ & = \int_0^{2\pi} \int_0^{2\pi} (1 + 1 + 1) \mathbf{T} \cdot d\mathbf{r} \\ & = \int_0^{2\pi} \int_0^{2\pi} 3 \mathbf{T} \cdot d\mathbf{r} \end{aligned}$$

$$\int_C \mathbf{F} \cdot d\mathbf{r} = 3 \int_0^{2\pi} \int_0^{2\pi} 1 \, d\theta \, d\phi = 3 \int_0^{2\pi} 2\pi \, d\theta = 3 \cdot 2\pi \cdot 2\pi = 12\pi^2$$

It follows that the volume integral is equal to the surface integral

20. Compute  $\int_C \mathbf{F} \cdot d\mathbf{r}$  where  $\mathbf{F}(x, y, z) = x^2\mathbf{i} + y^2\mathbf{j} + z^2\mathbf{k}$  and  $C$  is the curve of intersection of the plane  $x + y + z = 1$  and the cylinder  $x^2 + y^2 = 4$ , oriented in the counterclockwise direction when viewed from above
